SUMMARY

Backend engineer with 5+ years building distributed systems and blockchain infrastructure. Led a 9-person team building a bank-grade security platform under ISO 27001 at NST Cyber, and worked on EVM event-ingestion, notifications and bot infrastructure at Kleros. Strong end-to-end ownership backed by a security background (OSCP).

PROFESSIONAL EXPERIENCE

Kleros, Remote

Feb 2024 - May 2026

Backend Engineer

- Split a monolithic app to resolve a scaling conflict between bots and APIs. Initiated the architectural discussion, led monorepo setup and the full split with production data migration preserving user state
- Found 4 medium-severity issues in Kleros v2 arbitration contract during security reviews using manual analysis, formal verification (Halmos), and stateful fuzzing (Echidna)
- Built Kleros v1's multi-network automation bot (dispute progression, juror staking, with transaction simulation to prevent reverts, batched calls to cut gas) and the full-lifecycle juror notification system
- Architected a NestJS based blockchain event ingestion service for EVM chains, with runtime-configurable chains and contracts; emits events for async downstream processing

NST Cyber, Remote

Mar 2021 - Feb 2024

Software Engineer Team Lead

Jan 2023 - Feb 2024

- Led team of 9 building a vulnerability triage and threat intelligence platform for banks under ISO 27001 compliance
- Owned design and development of Assure v2, chose the stack, learned the new stack and architecture while building, wrote ~70% of backend code, shipped in 6 months. Replaced a \$200K/year low-code platform that couldn't support 3-level tenancy, data residency, isolation modes, or white-labeling
- Initiated and developed Terraform IaC from scratch covering the full serverless stack (Lambda, VPC/NAT, S3, CloudFront, CloudFront Functions), replacing a manual ~2-hour deploy with a repeatable 10–15-minute one
- Replaced auto-triggering on S3 uploads with explicit Kafka-message triggers for the Tigress-Assure ingestion Lambda; deployed MSK on AWS to unblock production rollout
- Created database connection-pool library for Assure v2 backend, simplifying queries and connections across logical and physical databases and eliminating DB connection overhead and slow responses in API endpoints

Software Engineer

Mar 2021 - Jan 2023

- Built Assure v1 in OutSystems in ~3 months. Wrote ~70% of production code (frontend and backend). Ran in production until platform limits triggered the v2 rebuild
- Developed the Tigress backend in Django REST Framework. Owned 100% of database design; authored most of the core API; designed a serializer abstraction adopted across most endpoints that reduced duplication
- Resolved distributed-task bottleneck in Tigress scanning engine by restructuring Celery dispatch for cross-instance execution, reducing scan time and compute/memory footprint
- Created an asset discovery and vulnerability scanning tool in Bash with client-ready reports. The tool's structure later informed the tool-orchestration design of the Tigress scanning engine

EDUCATION & CERTIFICATES

Offensive Security Certified Professional, OffSec

FEB 2017

IIT Bombay, India - Coursework in Metallurgical Engineering and Material Science

JUL 2011 - APR 2016

SKILLS

Programming Languages & Databases: TypeScript, Python, JavaScript, Solidity, PostgreSQL, MongoDB, MySQL

Frameworks: NestJS, Django REST Framework, Express, Angular, React, Next.js, GraphQL, Viem, Ethers.js

Infrastructure and Platform: AWS (Lambda, ECS, S3, RDS), Docker, Terraform, Kafka, Celery, OutSystems
